Are you looking for a clean and simple alternative to Windows Explorer that will help you find what you're looking for quickly and effectively? If so, then you should download and use Wugzilla - a desktop manager that makes Windows Explorer's search functionality a thing of the past. Wugzilla is a program that combines the functionality of the Windows Explorer and various online and offline search engines to help you find what you are looking for with ease. However, before you go downloading the software, you should know what it can do for you and what it's capable of, because its feature list isn't really that long and you may end up with all sorts of surprises. Firstly, if you happen to search for a file, Wugzilla can query both the hard drive and the Internet, so if you can't find the file you're looking for, chances are that you haven't looked in all the right places yet. If you still find a file that you need, then you can use the program's built-in search feature to find it by copying the file to your hard drive, or you can search the registry for it. The search feature doesn't actually do an exhaustive search though, so it will only reveal files that were actually there. The software can also produce previews, play music, or open a number of applications based on your search criteria. For instance, you can search for music, open the Music Player, and/or call up the Internet radio. You could also use Wugzilla to find a PDF reader, a browser, a multimedia player, or anything else you want in a long list of possible results. Another feature that you may not notice at first glance is the ability to "add" files, applications, and web sites to the program's favorites, which you can then access at any time by typing the corresponding shortcut into the program's Searching window. All in all, Wugzilla has some features that you won't see in many software, and if you don't mind its simplicity, then it can definitely come in handy. Features: -Multi-language. -Search files, contacts, emails, web pages, and more. -Internet, network and database search. -Create, launch, or find files, applications, and websites. -Find anything you need on your computer, including music
